# CS601: Software Development for Scientific Computing

Autumn 2021

Week6:

Structured Grids (Elliptic PDEs contd..)

#### Last Week...

- Intermediate C++
  - Class templates, STL, Operator overloading
- Structured Grids (Elliptic PDEs introduction)

- 1. Approximate the derivatives of  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y)$  using central differences
- 2. Choose step sizes  $\delta x$  and  $\delta y$  for x and y axis resp.
  - 1. Both and x and y are independent variables here.
  - 2. Choose  $\delta x = \delta y = h$
- 3. Write difference equation for approximating the PDE above

1. Approximate the derivatives of  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y)$  using central differences

$$\frac{\partial^2 u}{\partial x^2} \approx \frac{\left(u(x+\delta x,y) - 2u(x,y) + u(x-\delta x,y)\right)}{(\delta x)^2}$$

$$\frac{\partial^2 u}{\partial y^2} \approx \frac{\left(u(x, y + \delta y) - 2u(x, y) + u(x, y - \delta y)\right)}{(\delta y)^2}$$

Where,  $\delta x$  and  $\delta y$  are step sizes along x and y direction resp.

• Substituting in 
$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y)$$
:

$$\frac{\left(u(x+\delta x,y)-2u(x,y)+u(x-\delta x,y)\right)}{(\delta x)^2}$$

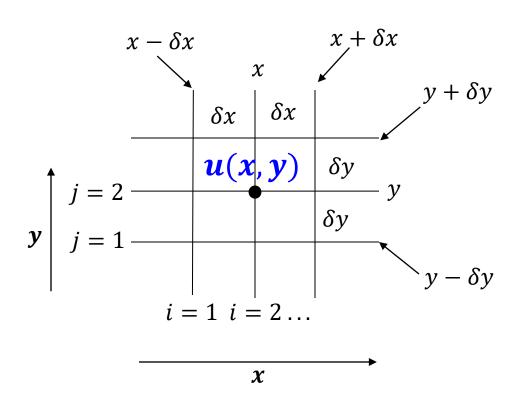

+

$$\frac{\left(u(x,y+\delta y)-2u(x,y)+u(x,y-\delta y)\right)}{(\delta y)^2}$$

$$\frac{\left(u(x+\delta x,y)+u(x,y+\delta y)-4u(x,y)+u(x-\delta x,y)+u(x,y-\delta y)\right)}{(h)^2}$$

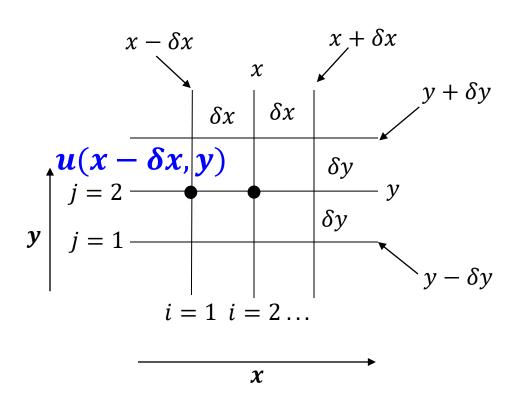

$$= f(x, y)$$

• Representing u(x, y)

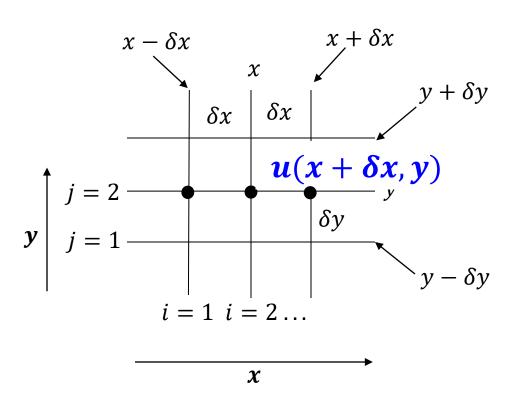

Notation:  $u_{i,j}$ 

• Representing  $u(x - \delta x, y)$ 

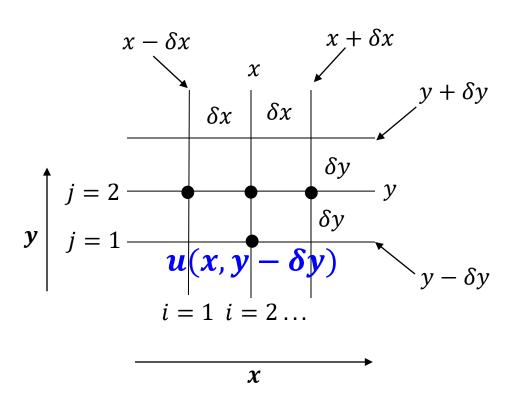

Notation:  $u_{i-1,i}$ 

• Representing  $u(x + \delta x, y)$ 

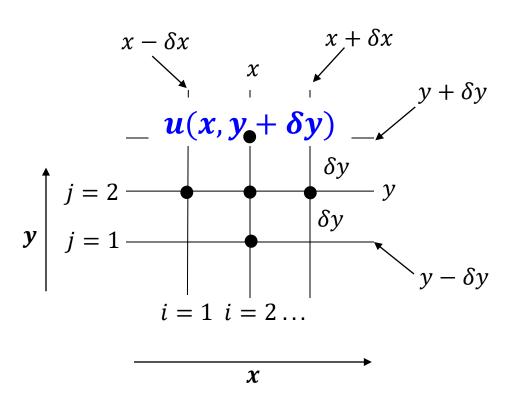

Notation:  $u_{i+1,j}$ 

• Representing  $u(x, y - \delta y)$ 

Notation:  $u_{i,i-1}$ 

• Representing  $u(x, y + \delta y)$ 

Notation:  $u_{i,j+1}$ 

#### Rewriting:

$$\frac{\left(u(x + \delta x, y) + u(x, y + \delta y) - 4u(x, y) + u(x - \delta x, y) + u(x, y - \delta y)\right)}{(h)^{2}}$$

$$= f(x, y)$$

$$u_{i+1,j} + u_{i,j+1} - 4u_{i,j} + u_{i-1,j} + u_{i,j-1}$$

$$h^{2}$$

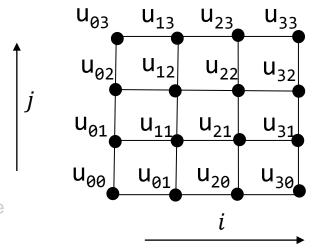

$$u_{i,j}$$

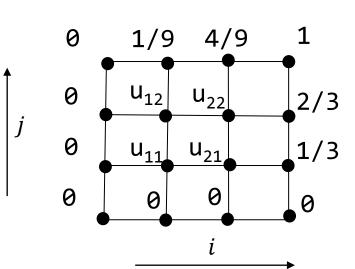

$$j$$
5-point stencil

Consider the boundary-value problem:

 $u_{xx} + uyy = 0$  in the square 0 < x < 1, 0 < y < 1 $u = x^2y$  on the boundary, h = 1/3

$$\frac{u_{i+1,j} + u_{i,j+1} - 4u_{i,j} + u_{i-1,j} + u_{i,j-1}}{h^2} = 0$$

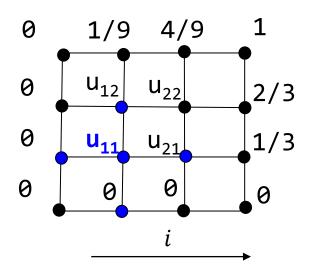

Computing u<sub>11</sub>

$$(u_{i+1,j} + u_{i,j+1} - 4u_{i,j} + u_{i-1,j} + u_{i,j-1} = 0)$$

$$u_{21} + u_{12} - 4u_{11} + u_{01} + u_{10} = 0$$

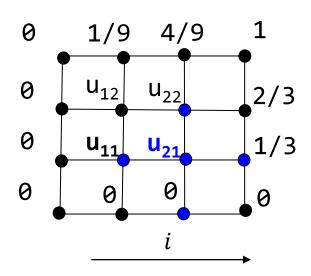

$$u_{21} + u_{12} - 4u_{11} + 0 + 0 = 0$$

Computing u<sub>21</sub>

$$(u_{i+1,j} + u_{i,j+1} - 4u_{i,j} + u_{i-1,j} + u_{i,j-1} = 0)$$
  
 $u_{31} + u_{22} - 4u_{21} + u_{11} + u_{20} = 0$ 

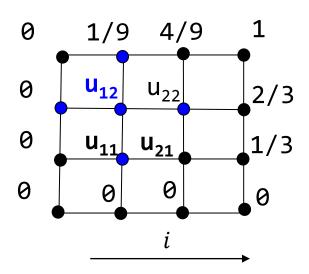

$$1/3 + u_{22} - 4u_{21} + U_{11} + 0 = 0$$

Computing u<sub>12</sub>

$$(u_{i+1,j} + u_{i,j+1} - 4u_{i,j} + u_{i-1,j} + u_{i,j-1} = 0)$$
  
 $u_{22} + u_{13} - 4u_{12} + u_{02} + u_{11} = 0$ 

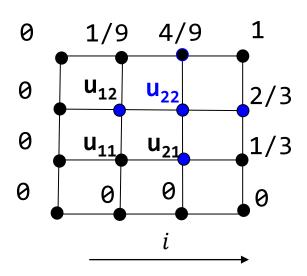

$$u_{22} + 1/9 - 4u_{12} + 0 + u_{11} = 0$$

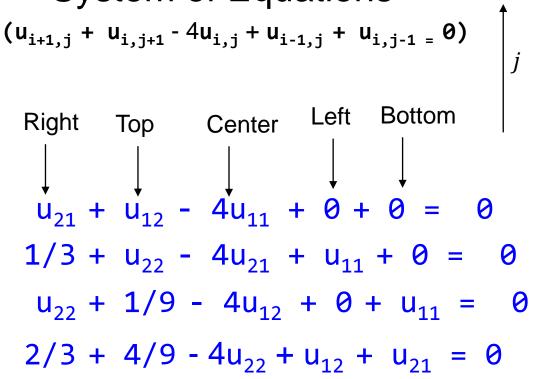

Computing u<sub>22</sub>

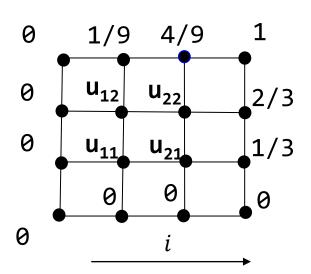

$$(u_{i+1,j} + u_{i,j+1} - 4u_{i,j} + u_{i-1,j} + u_{i,j-1} = 0)$$
  
 $u_{32} + u_{23} - 4u_{22} + u_{12} + u_{21} = 0$ 

$$2/3 + 4/9 - 4u_{22} + u_{12} + u_{21} = 0$$

#### System of Equations

Computing System of Equations:

$$u_{21} + u_{12} - 4u_{11} + 0 + 0 = 0$$
 $1/3 + u_{22} - 4u_{21} + u_{11} + 0 = 0$ 
 $u_{22} + 1/9 - 4u_{12} + 0 + u_{11} = 0$ 
 $2/3 + 4/9 - 4u_{22} + u_{12} + u_{21} = 0$ 

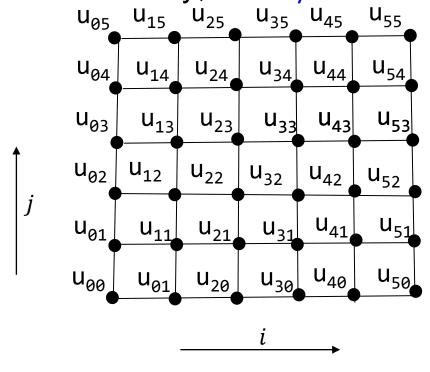

$$\begin{pmatrix} -4 & 1 & 1 & 0 \\ 1 & -4 & 0 & 1 \\ 1 & 0 & -4 & 1 \\ 0 & 1 & 1 & -4 \end{pmatrix} \begin{pmatrix} u_{11} \\ u_{21} \\ u_{12} \\ u_{22} \end{pmatrix} = \begin{pmatrix} 0 \\ -1/3 \\ -1/9 \\ -10/9 \end{pmatrix}$$

$$A \qquad x = B$$
Matrix A has only coefficients

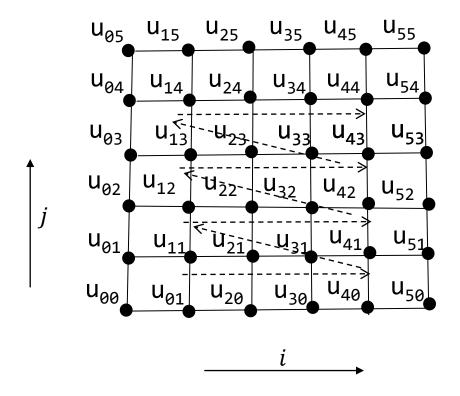

Matrix A has only coefficients

Consider the boundary-value problem:

 $u_{xx} + u_{yy} = 0$  in the square 0 < x < 1, 0 < y < 1 $u = x^2y$  on the boundary, h = 1/5

 Computing stencil (boundary values are all given): 16 unknowns (u<sub>11</sub> to u<sub>44</sub>), So, 16 equations.

#### Computing Stencil – Iterative Methods

- Jacobi and Gauss-Seidel
  - Start with an initial guess for the unknowns u<sup>0</sup>;
  - Improve the guess u<sup>1</sup><sub>ij</sub>
  - Iterate: derive the new guess, u<sup>n+1</sup><sub>ij</sub>, from old guess
     u<sup>n</sup><sub>ij</sub>
- Solution (Jacobi):
  - Approximate the value of the center with old values of (left, right, top, bottom)

#### Background – Jacobi Iteration

- Goal: find solution to system of equations represented by AX=B
- Approach: find sequence of approximations X<sup>0</sup>
   X<sup>1</sup> X<sup>2</sup> . . . X<sup>n</sup> which gradually approach X .
   X<sup>0</sup> is called initial guess, X<sup>1</sup> s called *iterates*

#### Method:

Split A into A=L+D+U e.g.

$$\begin{pmatrix} -4 & 1 & 1 & 0 \\ 1 & -4 & 0 & 1 \\ 1 & 0 & -4 & 1 \\ 0 & 1 & 1 & -4 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 1 & 1 & 0 \end{pmatrix} + \begin{pmatrix} -4 & 0 & 0 & 0 \\ 0 & -4 & 0 & 0 \\ 0 & 0 & -4 & 0 \\ 0 & 0 & 0 & -4 \end{pmatrix} + \begin{pmatrix} 0 & 1 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$
Nikhil Hegde

#### Background – Jacobi Iteration

Compute: AX=B is (L+D+U)X=B

$$\Rightarrow$$
 DX = -(L+U)X+B

$$\Rightarrow$$
 DX<sup>(k+1)</sup>= -(L+U)X<sup>k</sup>+B (iterate step)

$$\Rightarrow X^{(k+1)} = D^{-1} (-(L+U)X^k) + D^{-1}B$$

(As long as D has no zeros in the diagonal  $X^{(k+1)}$  is obtained)

• E.g. 
$$\begin{pmatrix} -4 & 0 & 0 & 0 \\ 0 & -4 & 0 & 0 \\ 0 & 0 & -4 & 0 \\ 0 & 0 & 0 & -4 \end{pmatrix} \begin{pmatrix} u_{11} \\ u_{21} \\ u_{12} \\ u_{22} \end{pmatrix} = -\begin{pmatrix} 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \\ 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 \end{pmatrix} \begin{pmatrix} u_{11} \\ u_{21} \\ u_{12} \\ u_{22} \end{pmatrix} + \begin{pmatrix} 0 \\ -1/3 \\ -1/9 \\ -10/9 \end{pmatrix},$$

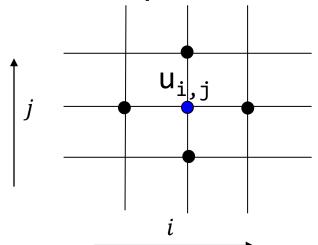

u<sub>ij</sub> 's value in (1)<sup>st</sup> iteration is computed based on u<sub>ij</sub> values computed in (0)<sup>th</sup> iteration

#### Background – Jacobi Iteration

• E.g. 
$$\begin{pmatrix} -4 & 0 & 0 & 0 \\ 0 & -4 & 0 & 0 \\ 0 & 0 & -4 & 0 \\ 0 & 0 & 0 & -4 \end{pmatrix} \begin{pmatrix} u_{11} \\ u_{21} \\ u_{12} \\ u_{22} \end{pmatrix} = -\begin{pmatrix} 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \\ 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 \end{pmatrix} \begin{pmatrix} u_{11} \\ u_{21} \\ u_{12} \\ u_{22} \end{pmatrix} + \begin{pmatrix} 0 \\ -1/3 \\ -1/9 \\ -10/9 \end{pmatrix},$$

 $u_{ij}$  's value in  $(k+1)^{st}$  iteration is computed based on  $u_{ij}$  values computed in  $(k)^{th}$  iteration

Center's value is updated. Why?

5-point stencil

- Jacobi and Gauss-Seidel (Solution approach)
  - Start with an initial guess for the unknowns u<sup>0</sup>;
  - Improve the guess u<sup>1</sup><sub>ij</sub>
  - Iterate: derive the new guess, u<sup>n+1</sup><sub>ij</sub>, from old guess
     u<sup>n</sup><sub>ij</sub>
- Solution (Jacobi):
  - Approximate the value of the center with old values of (left, right, top, bottom)

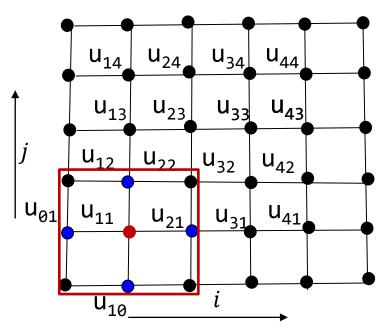

• 
$$u_{right} + u_{top} - 4u_{center} + u_{left} + u_{bottom} = 0$$
  
=>  $u_{center} = 1/4(u_{right} + u_{top} + u_{left} + u_{bottom})$ 

Applying Jacobi Iteration:

$$u_{center}^{(k+1)} = 1/4(u_{right}^{(k)} + u_{top}^{(k)} + u_{left}^{(k)} + u_{bottom}^{(k)})$$

Example: applying Jacobi Iteration:

$$u_{center}^{(k+1)} = 1/4(u_{right}^{(k)} + u_{top}^{(k)} + u_{left}^{(k)} + u_{bottom}^{(k)})$$

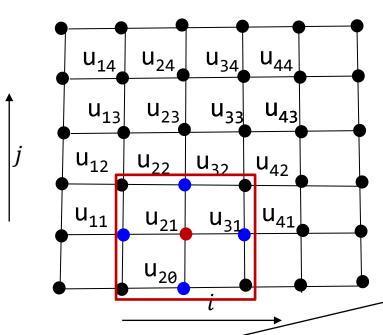

#### Iteration 1

1) Compute  $u_{11}$  using initial guess for  $u_{12}$  and  $u_{21}$ .  $u_{01}$  and  $u_{10}$  are known from boundary conditions

Example: applying Jacobi Iteration:

$$u_{center}^{(k+1)} = 1/4(u_{right}^{(k)} + u_{top}^{(k)} + u_{left}^{(k)} + u_{bottom}^{(k)})$$

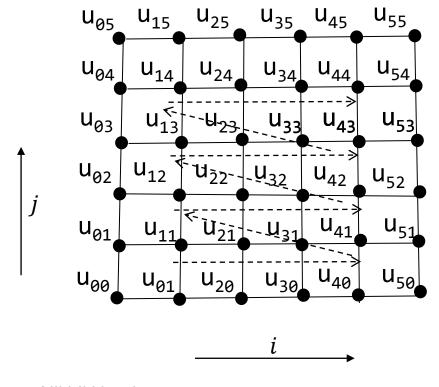

Nikhil Hegde

#### Iteration 1

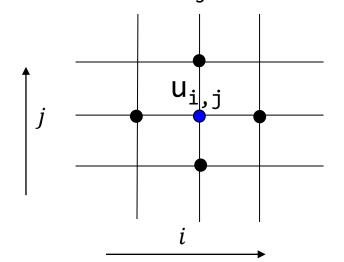

- 1) Compute  $u_{11}$  using initial guess for  $u_{12}$  and  $u_{21}$ .  $u_{01}$  and  $u_{10}$  are known from boundary conditions
- 2) Compute  $u_{21}$  using initial guess for  $u_{11}$ ,  $u_{31}$ , and  $u_{22}$ .  $u_{20}$  are known from boundary conditions

In 2), note that the initial guess for  $u_{11}$  is used even though  $u_{11}$  was updated just before in 1)

 In every iteration, suppose we follow the computing order as shown (dashed):

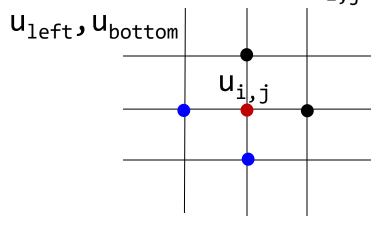

In any iteration, what are all the points of a 5-point stencil already updated while computing  $u_{ij}$ ?

Nikhil Hegde

What are the points that are already computed at u<sub>i,i</sub>?

#### Background – Gauss-Seidel Iteration

Compute: AX=B is (L+D+U)X=B

$$\Rightarrow$$
 (L+D)X = -UX+B

$$\Rightarrow$$
 (L+D)X<sup>(k+1)</sup>= -UX<sup>k</sup>+B (iterate step)

$$\Rightarrow X^{(k+1)} = (L+D)^{-1} (-UX^k) + (L+D)^{-1}B$$

(As long as L+D has no zeros in the diagonal  $X^{(k+1)}$  is obtained)

• E.g. 
$$\begin{pmatrix} -4 & 0 & 0 & 0 \\ 1 & -4 & 0 & 0 \\ 1 & 0 & -4 & 0 \\ 0 & 1 & 1 & -4 \end{pmatrix} \begin{pmatrix} u_{11} \\ u_{21} \\ u_{12} \\ u_{22} \end{pmatrix} = - \begin{pmatrix} 0 & 1 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} u_{11} \\ u_{21} \\ u_{12} \\ u_{22} \end{pmatrix} + \begin{pmatrix} 0 \\ -1/3 \\ -1/9 \\ -10/9 \end{pmatrix}$$

#### Computing Stencil – Gauss-Seidel

Gauss-Seidel: Applying for 2D Laplace Equation

$$u_{center}^{(k+1)} = 1/4(u_{right}^{(k)} + u_{top}^{(k)} + u_{left}^{(k+1)} + u_{bottom}^{(k+1)})$$

- Gauss-Seidel: Observations
  - For a given problem and initial guess, Gauss-seidel converges faster than Jacobi
  - An iteration in Jacobi can be parallelized

# Program Representation – Structured Grids

#### Requirements:

- Grid dimension shall not be hardcoded
  - Consequence: implementations must define a compile-time constant
- Grid step size shall not be hardcoded E.g. h=1/3, h=1/5 etc.
  - Consequence: can't define int arr[m][n]; //m,n to be constant expr.
- A grid point shall be identified with cartesian coordinates / polar coordinates (e.g. with angle and radius from origin)
  - Shall be able to generate a structured grid given number of points, xi, and eta.
- Shall allow access to any grid point
- Shall allow for implementation of grid operators

# Structured Grids - Representation

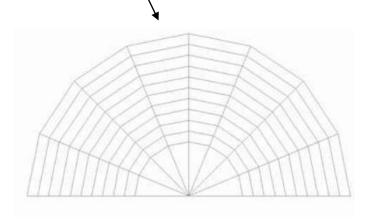

- Because of regular connectivity between cells
  - Cells can be identified with indices (x,y) or (x,y,z) and neighboring cell info can be obtained.
  - How about identifying a cell here?
     Given:

$$\xi$$
 = ("Xi") radius  $\eta$  = ("Eta") angle

#### Compute:

$$x = \left(\frac{1}{2} + \xi\right) \cos(\pi \eta)$$

Nikhil Hegde 
$$y = \left(\frac{1}{2} + \xi\right) \sin(\pi \eta)$$

#### class Domain

We discretize the domain using a grid

```
class Domain{
    public:
        generate_grid(int m, int n);
        Domain(); // constructor
        //...
    private:
        //...
};
```

#### Method generate\_grid

What is the shortcoming of the following method?

Assumes a 2D grid.

#### **Grid Function**

- We let a grid function to operate on the grid points
  - Example of an operator: numerical differentiation
  - Different operations possible
  - Note: grid function always operates on some grid.
  - Many functions may operate on the same grid.

```
class GridFn{
    public:
        //...
    private:
        Domain* d; //aggregation
        //...
};
```

#### Boundary conditions

Multiple options: affect the accuracy of the solution

| Name                  | Prescription                   | Interpretation             |
|-----------------------|--------------------------------|----------------------------|
| Dirichlet (essential) | u                              | Fixed temperature          |
| Neumann<br>(Natural)  | ∂u/∂n                          | Energy Flow                |
| Robin (Mixed)         | $\partial u/\partial n + f(u)$ | Temperature dependent flow |

How to represent boundary conditions?

#### Solution

pseudo-code

```
1 Domain dom; // create domain
2 GridFn g(dom); //create grid function to operate on a domain
3 Solution u(g) //prepare to compute a solution:
4 u.initcond() //1) set initial conditions
5 for(int step=0; step<maxsteps; step++) 2) iterate:
6 {
7          u.compute(); //2) compute solution repeatedly
8 }</pre>
```

#### class Solution

We discretize the domain using a grid

```
class Solution{
   public:
        Solution(GridFn* d): sol(d) {}
        initcond();
        boundarycond();
        //... other member functions?
   private:
        GridFn* sol;
};
```

#### What is missing?

- Data array?
- Type of data as template parameter?
- Operation on subgrids (Box)?
